1 Responsibilities introduction

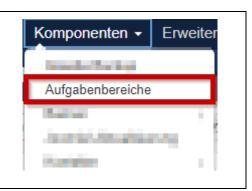

The component Responsibilities is an extensions for the Content-Management-System (CMS) Joomla.

2 Backend

2.1 Calling the component in the backend

Log in as an administrator:

At first you need to log in into the Joomla administration backend. After that you can open the componenten via Components >> Responsibilities aufrufen.

2.2 Define categories

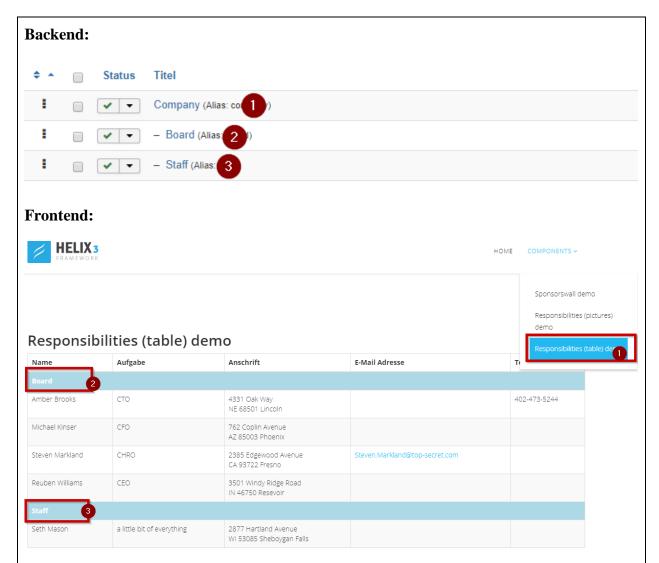

The first task you need to complete is defining some categories.

Open categories:

Open Categories by using the subnavigation placed on the left side.

The output in the frontend is controlled by the categories. The interaction between categories and the frontend output can be explained most simply by looking at the following pictures:

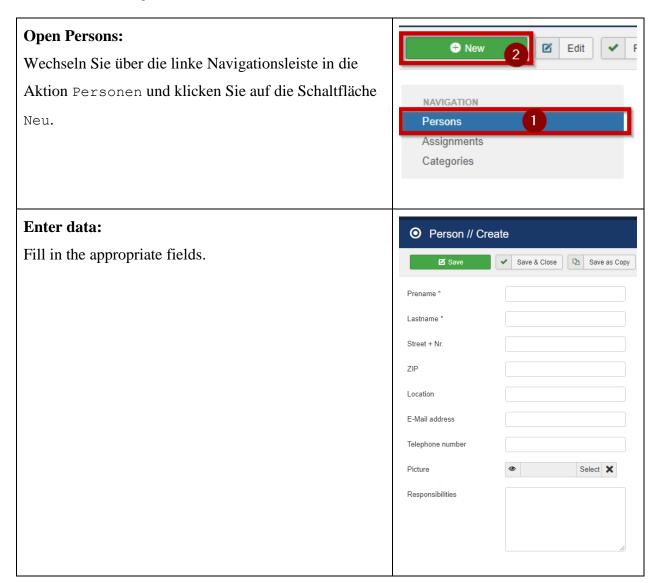

The parent category (here: "Company"), is only a container and intended for identification. If a menu item is created later on, the parent category to be displayed is selected while creating the menu item.

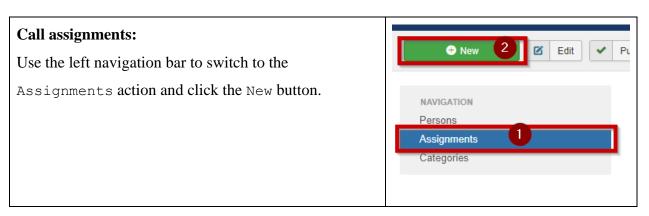

The first child level defines the individual sections, i.e. it is the actual categorization.

Deeper nested categories are not supported by the component and are ignored. The component only works with level-0 (parent level) and level-1 (first child level).

2.3 Create a person

2.4 Assigning a person to a category

Select a category: In the first step, select the category for which you want to create a new assignment. Select source: In the next step, select the source	Define assignment Category * - Please select Please select - Company I- Board I- Staff Linkage * - Please select - Please select - Please select - Data of component Joomla User Account
 Data from component: Select this selection option if you want to link a person you have created within the component, as described in chapter Fehler! Verweisquelle konnte nicht gefunden werden Joomla user account: Select this option if you want to link the data from a Joomla user account. 	
Select person: In the next step, select the person to be linked. Depending on the selection of the "source" of the link you get a different view of the selection option.	Linkage * Data of component Select person Please select Linkage * Joomla User Account Joomla User Account Select a User
Save: Now save 1x. Saving is important at this point so that the link updates the data for the input mask of the "Overwrite values" fields.	☑ Speichern

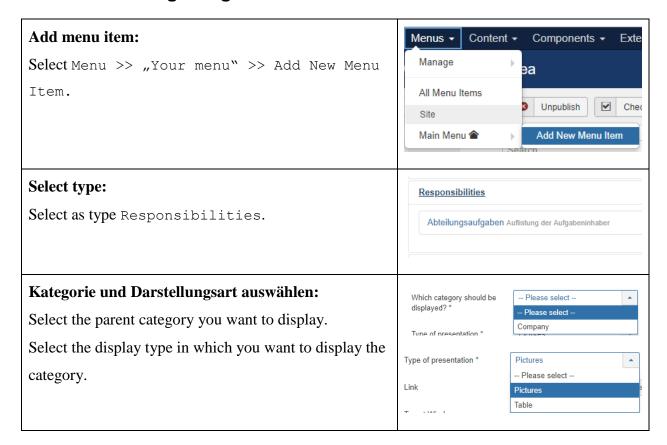

2.5 Override values

Within the Assignment view, you have the option of overwriting values. The idea behind this function is that a created person can be assigned to several categories. It may happen that some stored data is not correct for the category. For example, one and the same person works in one category as a board member and in another category as a trainer. Instead of creating the same person twice, we simply overwrite the task area for the second assignment. http://www.agmedia.de

If a Joomla user account is linked, then Joomla only uses the first name, last name and e-mail address. All further information must be entered via the override fields during assignment.

Open assignment:		c					
Select Responsib	ilities >> Assignments >>	I Brooks Anther Company I Board					
"Open entry of	your choice".						
Override values:							
Overwriting values							
Override Values!							
After you have saved the entry, the values defined for the person are in the override fields. This helps you to decide if and which values you want to overwrite.							
Tip: If you do not want to display the contents of a field in the frontend, simply overwrite the value with a whitespace.							
E-Mail address	Nicht definiert						
Street + Nr.	3501 Windy Ridge Road						
ZIP	IN 46750						
Location	Resevoir						
Telephone number	Nicht definiert
